Thiazolyl-pyridine derivatives and their use as gastric acid secretion inhibitors

The present invention relates to novel substituted thiazole compounds, processes for their preparation, intermediates useful in their preparation, pharmaceutical compositions containing them, and their use in therapy, in particular as gastric acid secretion inhibitors.

The present invention therefore provides, compounds of 10 structure (I):

$$\begin{array}{c|c}
R^4 & R^3 \\
R & N \\
R & R
\end{array}$$
(1)

in which

25

15 R¹ is optionally substituted phenyl;

R² is C₁₋₆alkyl or (CH₂)_nAr in which n is 0 to 2 and Ar is optionally substituted phenyl;

 R^3 is hydrogen or C_{1-4} alkyl;

 R_4 is hydrogen, C_{1-4} alkyl, NR^7R^8 or OC_{1-4} alkyl;

20 R^5 is hydrogen or C_{1-4} alkyl;

 R^6 is hydrogen, C_{1-4} alkyl or NR^7R^8 ;

 R^7 and R^8 are the same or different and are each hydrogen or C_{1-4} alkyl or one of R^7 and R^8 is hydrogen and the other is hydroxy C_{1-4} alkyl, or R^7 and R^8 , together with the nitrogen atom to which they are attached, form a 5- or 6-membered ring optionally containing one or more additional heteroatoms;

and the salts thereof.

Suitably, R¹ is hydrogen or optionally substituted phenyl. Preferably R¹ is an optionally substituted phenyl group.

÷

f

20

Suitable substituted phenyl groups R^1 include phenyl groups substituted by 1 to 3 substituents selected from C_{1-6} alkyl, C_{1-6} alkoxy, amino, C_{1-6} alkylthio, halogen, cyano, hydroxy, carbamoyl, carboxy, C_{1-6} alkanoyl or trifluoromethyl. Preferred substituted phenyl groups are those substituted by a single substituent, in particular a methyl group, most preferably in the 2-position of the ring.

Suitably, R^2 is C_{1-6} alkyl or $(CH_2)_nAr$; preferably R^2 is C_{1-6} alkyl, in particular n-propyl.

Suitably, n is 0 to 2, preferably n is 0 or 1.

Suitable substituted phenyl groups Ar are as defined for substituted phenyl groups R¹.

Suitably, R^3 is hydrogen or C_{1-4} alkyl; preferably R^3 is hydrogen.

Suitably R^4 is hydrogen, C_{1-4} alkyl, NR^7R^8 or OC_{1-4} alkyl; preferably R^4 is NR^7R^8 .

Suitably R^5 is hydrogen or C_{1-4} alkyl; preferably R^5 is 25 hydrogen.

Suitably R^6 is hydrogen, C_{1-4} alkyl or NR^7R^8 ; preferably R^6 is hydrogen.

Suitably, R⁷ and R⁸ are the same or different and are each hydrogen or C₁₋₄alkyl or one of R⁷ and R⁸ is hydrogen and the other is hydroxyC₁₋₄alkyl, or R⁷ and R⁸, together with the nitrogen atom to which they are attached, form a 5-or 6-membered ring optionally containing one or more additional heteroatoms. Preferably R⁷ and R⁸ are the same and are both hydrogen.

Suitable 5- or 6-membered rings formed by R^7 and R^8 , together with the nitrogen atom to which they are attached, include, for example, pyrrolidino, morpholino, piperidino and piperazino rings.

5

ŧ

The compounds of structure (I) can be prepared by processes analogous to those known in the art. The present invention provides in a further aspect a process for the preparation of a compound of structure (I) which comprises

10

a) reaction of a compound of structure (II) with a compound of structure (III):

15

*

in which R^1 to R^6 are as described for structure (I), and X is halogen;

b) for compounds in which one of R^4 or R^6 is NR^7R^8 , 20 reaction of a compound of structure (IV):

$$\begin{array}{c|c}
 & R^{3} & R^{1} & S \\
 & R^{5} & N & R^{2} \\
 & X & X & N
\end{array}$$
(IV)

in which R^1 , R^2 , R^3 and R^5 are as described for structure 25 (I) and one of X^1 and X^2 is halogen and the other is R^4 or

3

30

 R^6 as appropriate, with a suitable amine of structure HNR^7R^8 in which R^7 and R^8 are as described for structure (I);

for compounds in which one of R^4 or R^6 is NH_2 , 5 reduction of a compound of structure (IV) in which X^{\perp} or X^{2} is Na; and

optionally thereafter, forming a salt.

Suitably, X is halogen such as chlorine or bromine; 10 preferably X is bromine. Suitably X¹ or X² is halogen such as chlorine or bromine; preferably x^1 or x^2 is chlorine.

The reaction between a compound of structure (II) and a 15 compound of structure (III) is carried out in a suitable solvent at a temperature of between ambient and the reflux temperature of the solvent used, until the reaction is complete. Suitable solvents include, for example, C_{1-4} alkanols such as methanol and ethanol, in particular 20 ethanol. Preferably the reaction is carried out at the reflux temperature of the solvent used.

Compounds of structure (II) can themselves be prepared according to procedures known to those skilled in the art. 25 For example, compounds of structure (II) in which X is bromine, can be prepared from the corresponding precursors in which X is hydrogen, by reaction with, for example, bromine/hydrobromic acid at elevated temperature, preferably at reflux temperature, or with copper (II) bromide, in a suitable solvent medium (for example chloroform/ethyl acetate) at elevated temperature, preferably reflux temperature. The precursor compounds of structure (II) in which X is hydrogen, can be prepared from the corresponding 2-cyanopyridine of structure (V) and corresponding Grignard 35 reagent (VI):

- 5 -

in which ${\mbox{R}}^1$ and ${\mbox{R}}^3$ to ${\mbox{R}}^6$ are as described for structure (I) and X is halogen.

5

The starting compounds of structures (V) and (VI) are commercially available or can be prepared by standard techniques from commercially available precursors.

The reaction between compounds of structure (IV) and suitable amines of structure HNR⁴R⁵ can be carried out in a suitable solvent such as industrial methylated spirits, at elevated temperature, preferably under pressure, for example in a sealed pressure vessel at elevated temperature.

15

The intermediate compounds of structure (IV) are prepared by standard techniques, for example, by reaction of the corresponding pyridine-N-oxides (VII) with, for example phosphorous oxychloride.

20

$$\begin{array}{c|c}
R^{4} & R^{3} & R^{1} \\
\hline
R^{5} & N & O \\
\hline
R & R & O
\end{array}$$
(VII)

The reduction of compounds of structure (IV) in which X^1 is azide is carried out by hydrogenation over a noble metal catalyst, such as palladium on carbon. The intermediates of structure (IV) in which X^1 is azide can be

- 6 -

prepared from the corresponding compounds of structure (VII) by reaction with $(PhO)_2P(O)N_3$

Ż

The intermediates of structure (VII) can be prepared from the corresponding compounds of structure (I) in which \mathbb{R}^3 to \mathbb{R}^6 are all hydrogen, by reaction with a suitable oxidising agent such as m-chloroperbenzoic acid.

The compounds of structure (I) and their

pharmaceutically acceptable salts exert an anti-secretory effect by inhibition of the gastrointestinal H⁺K⁺ATPase enzyme (Fellenius, E., Berglindh, T., Sachs, G., Olke, L., Elander, B., Sjostrand, S.E., and Wallmark, B., 1981, Nature, 290, 159-61).

15

20

In a further aspect therefore the present invention provides compounds of structure (I) and pharmaceutically acceptable salts thereof for use in therapy. The compounds of structure (I) and their pharmaceutically acceptable salts inhibit exogenously and endogenously stimulated gastric acid secretion and are useful in the treatment of gastrointestinal diseases in mammals, in particular humans.

Such diseases include, for example, gastric and duodenal ulcers, aspiration pneumonitis and Zollinger-Ellison Syndrome.

Further, the compounds of structure (I) can be used in the treatment of other disorders where an anti-secretory effect is desirable for example in patients with gastritis, NSAID induced gastritis, acute upper intestinal bleeding, in patients with a history of chronic and excessive alcohol consumption, and in patients with gastro oesophageal reflux disease (GERD).

35

30

In therapeutic use, the compounds of the present invention are usually administered in a standard pharmaceutical composition. The present invention

WO 93/15071

therefore provides in a further aspect pharmaceutical compositions comprising a compound of structure (I) or a pharmaceutically acceptable salt thereof and a pharmaceutically acceptable carrier.

5

10

ì.

The compounds of structure (I) and their pharmaceutically acceptable salts which are active when given orally can be formulated as liquids, for example syrups, suspensions or emulsions, tablets, capsules and lozenges.

A liquid formulation will generally consist of a suspension or solution of the compound or pharmaceutically acceptable salt in a suitable liquid carrier(s) for example, ethanol, glycerine, non-aqueous solvent, for example polyethylene glycol, oils, or water with a suspending agent, preservative, flavouring or colouring agent.

A composition in the form of a tablet can be prepared using any suitable pharmaceutical carrier(s) routinely used for preparing solid formulations. Examples of such carriers include magnesium stearate, starch, lactose, sucrose and cellulose.

- A composition in the form of a capsule can be prepared using routine encapsulation procedures. For example, pellets containing the active ingredient can be prepared using standard carriers and then filled into a hard gelatin capsule; alternatively, a dispersion or suspension can be prepared using any suitable pharmaceutical carrier(s), for example aqueous gums, celluloses, silicates or oils and the dispersion or suspension then filled into a soft gelatin capsule.
- 35 Typical parenteral compositions consist of a solution or suspension of the compound or pharmaceutically acceptable salt in a sterile aqueous carrier or parenterally acceptable oil, for example polyethylene glycol, polyvinyl pyrrolidone,

PCT/EP93/00176

ì

25

30

lecithin, arachis oil or sesame oil. Alternatively, the solution can be lyophilised and then reconstituted with a suitable solvent just prior to administration.

A typical suppository formulation comprises a compound of formula (I) or a pharmaceutically acceptable salt thereof which is active when administered in this way, with a binding and/or lubricating agent such as polymeric glycols, gelatins or cocoa butter or other low melting vegetable or synthetic waxes or fats.

Preferably the composition is in unit dose form such as a tablet or capsule.

Each dosage unit for oral administration contains suitably from 1 to 1000 mg, preferably from 1 to 500 mg (and for parenteral administration contains preferably from 0.1 to 25 mg) of a compound of the formula (I) or a pharmaceutically acceptable salt thereof calculated as the free base.

The present invention also provides a method of inhibiting gastric acid secretion which comprises administering to a mammal in need thereof an effective amount of a compound of the formula (I) or a pharmaceutically acceptable salt thereof; and a method of treatment of diseases of the stomach or intestine based on increased acid secretion which comprises administering to a mammal in need thereof an effective amount of a compound of the formula (I) or a pharmaceutically acceptable salt thereof.

The pharmaceutically acceptable compounds of the invention will normally be administered to a subject for the treatment of gastrointestinal diseases and other conditions caused or exacerbated by gastric acidity. The daily dosage regimen for an adult patient may be, for example, an oral dose of between 1 mg and 1000 mg, preferably between 1 mg

- 9 -

and 500 mg, or an intravenous, subcutaneous, or intramuscular dose of between 0.1 mg and 100 mg, preferably between 0.1 mg and 25 mg, of the compound of the formula (I) or a pharmaceutically acceptable salt thereof calculated as the free base, the compound being administered 1 to 4 times per day.

Suitably the compounds will be administered for a period of continuous therapy, for example for a week or nore.

5

In addition, the compounds of the present invention can be co-administered with further active ingredients, such as antacids (for example magnesium carbonate or hydroxide and aluminium hydroxide), non-steroidal anti-flammatory drugs (for example indomethacin, aspirin or naproxen), steroids, or nitrite scavengers (for example ascorbic acid or aminosulphonic acid), or other drugs used for treating gastric ulcers (for example histamine H2-antagonists such as cimetidine), or agents having activity against Helicobacter pylori organisms, for example antibiotics such as amoxicillin.

The following examples illustrate the invention.

25 Temperatures are recorded in degrees centigrade.

j.

F

Example 1

2-Propyl-4-(2-pyridyl)-5-(2-methylphenyl)thiazole dihydrobromide

5 (i) 2-(2-Methylphenylacetyl)pyridine

A solution of α -bromo-o-xylene (9.25 g, 0.05 mol) in anhydrous ether (50 ml) was added dropwise under nitrogen to a stirred mixture of magnesium turnings (1.21 g, 0.05 10 mol) and anhydrous ether (15 ml) so as to maintain a gentle reflux. After a further 10 min, a solution of 2-cyanopyridine (5.2 g, 0.05 mol) in anhydrous ether (50 ml) was added dropwise over 15 min. The mixture was stirred for a further 2 hours, left to stand for 16 hours, then cooled in ice and a 20% aqueous ammonium chloride solution added 15 dropwise, followed by conc. hydrochloric acid (14 ml) to give two clear layers. The aqueous layer was separated and extracted with chloroform. The combined organic layers were dried and evaporated to a dark oil, which was purified by 20 flash chromatography (silica, dichloromethane) to give the title compound as an oil (4.86 g).

(ii) 2-(2-Methylphenylbromoacetyl)pyridine

- A solution of 2-(2-methylphenylacetyl)pyridine (21.26 g, · 25 0.1 mol) in 48% aqueous hydrobromic acid (100 ml) was heated at 100 °C whilst bromine (17.7 g. 0.11 mol) was added dropwise over 5 min. After a further 10 min the solution was allowed to cool, and the resulting solid filtered off 30 and washed with acetonitrile, then converted to the free base and crystallised from pet. ether to give the product (15.88 g), m.p. 53-55°C.
- (iii) 2-Propyl-4-(2-pyridyl)-5-(2-methylphenyl)thiazole 35 dihydrobromide

A solution of 2-(2-methylphenylbromoacetyl)pyridine (1.82 g, 6.27 mmol) and thiobutyramide (0.65 g, 6.27 mmol) in ethanol

- 11 -

(40 ml) was heated under reflux for 4 hours. The solvent was evaporated and the residue triturated with ether, slowly giving a crystalline solid. Conversion to the dihydrobromide and recrystallisation from ethanol/ether then from methanol/ether gave the title compound as a yellow solid (1.25 g), m.p. 200-201°C.

Example 2

2-Propyl-4-(6-methylamino-2-pyridyl)-5-(2-methylphenyl)thiazole

- (i) 2-Propyl-4-(1-oxo-2-pyridyl)-5-(2-methylphenyl)thiazole
- 2-Propyl-4-(2-pyridyl)-5-(2-methylphenyl)thiazole dihydrobromide (10.74 g, 28.6 mmol) was converted to the free base by treatment with sodium bicarbonate and extraction into dichloromethane. m-Chloroperbenzoic acid (55.93 g, 34.4 mmol) was added to the organic solution portionwise over about 5 min with stirring. The clear solution was left to stand for 16 hours, then cooled in ice, ammonia gas bubbled through, the precipitate filtered off and the filtrate evaporated to a brown oil. Flash chromatography (silica, methanol/dichloromethane) and crystallisation from pet. ether gave the title compound (6.87 g), m.p. 80-82°C.
- (ii) 2-Propyl-4-(6-chloro-2-pyridyl)-5-(2-methylphenyl)30 thiazole and 2-propyl-4-(4-chloro-2-pyridyl)-5-(2methylphenyl)thiazole

2-Propyl-4-(1-oxo-2-pyridyl)-5-(2-methylphenyl)thiazole
(2.15 g, 6.93 mmol) and phosphoryl chloride (5 ml, excess)
were heated at 120 °C for 1 hour. The excess phosphoryl chloride was evaporated, and the residue treated with icewater, basified with sodium bicarbonate and extracted with dichloromethane, then the extracts dried and evaporated.

(i) Preparation of lyophilised gastric vesicles (H/K-ATPase).

Lyophilised gastric vesicles were prepared from pig fundic mucosa after the method of Keeling et. al. (Biochem. Pharmacol., 34, 2967, 1985).

(ii) K⁺-stimulated ATPase activity.

K⁺-stimulated ATPase activity was determined at 37°C in the presence of the following: 10 mM Pipes/Tris buffer pH 7.0, 2 mM MgSO₄, 1 mM KCl, 2 mM Na₂ATP and 3-6 μg protein/ml lyophilised gastric vesicles. After incubation for 30 minutes, the inorganic phosphate hydrolysed from ATP was determined by the method of Yoda and Hokin (Biochem. Biophys. Res. Commun. 40, 880, 1970).

Compounds of structure (I) were dissolved in

dimethylsulphoxide which up to the highest
concentration used had no effect on K⁺-stimulated
ATPase activity. The effect of the highest
concentration of each compound of structure (I) on the
recovery of a standard amount of inorganic phosphate

was also determined.

- 18 -

Results

The compounds of the examples exhibited IC50 values in the range of between 1 and 100 μM_{\odot}

Claims:

1. A compound of structure (I):

 $\begin{array}{c|c}
R^{3} & R^{1} & S \\
R & N & R^{2} \\
R & R & R
\end{array}$ (1)

ż

in which

R¹ is optionally substituted phenyl;

R² is C₁₋₆alkyl or (CH₂)_nAr in which n is 0 to 2 and Ar is optionally substituted phenyl;

 R^3 is hydrogen or C_{1-4} alkyl;

 R_4 is hydrogen, C_{1-4} alkyl, NR^7R^8 or OC_{1-4} alkyl;

 R^5 is hydrogen or C_{1-4} alkyl;

 R^6 is hydrogen, C_{1-4} alkyl or NR^7R^8 ;

15 R⁷ and R⁸ are the same or different and are each hydrogen or C₁₋₄alkyl or one of R⁷ and R⁸ is hydrogen and the other is hydroxyC₁₋₄alkyl, or R⁷ and R⁸, together with the nitrogen atom to which they are attached, form a 5- or 6-membered ring optionally containing one or more additional heteroatoms;

or a salt thereof.

2. A compound according to claim 1 in which \mathbb{R}^1 is omethylphenyl.

25

- 3. A compound according to claim 2 in which \mathbb{R}^2 is n-propyl.
- 4. A compound according to claim 3 in which \mathbb{R}^3 is $\mathbb{R}^7\mathbb{R}^8$ in which \mathbb{R}^7 and \mathbb{R}^8 are both hydrogen.
 - 5. A compound of structure (I) which is:

- 20 -

ð

;

2-propyl-4-(2-pyridyl)-5-(2-methylphenyl)thiazole dihydrobromide;

2-propyl-4-(6-methylamino-2-pyridyl)-5-(2-methylphenyl)-thiazole;

5 2-propyl-4-(6-(2-hydroxyethylamino)-2-pyridyl)-5-(2-methylphenyl)thiazole;

2-propyl-4-(6-amino-2-pyridyl)-5-(2-methylphenyl)thiazole;

2-propyl-4-(4-amino-2-pyridyl)-5-(2-methylphenyl)thiazole;

2-methyl-4-(2-pyridyl)-5-(2-methylphenyl)thiazole

10 hydrobromide;

2-(2-methylphenyl)-4-(2-pyridyl)-5-(2-methylphenyl)-thiazole;

2-(phenylmethyl)-4-(2-pyridyl)-5-(2-methylphenyl)thiazole; or

- 15 2-propyl-4-(2-pyridyl)-5-phenylthiazole hydrobromide.
 - 6. A process for preparing a compound of structure (I) which comprises
- 20 a) reaction of a compound of structure (II) with a compound of structure (III):

- 25 in which R^1 to R^6 are as described for structure (I), and X is halogen;
 - b) for compounds in which one of R^4 or R^6 is NR^7R^8 , reaction of a compound of structure (IV):

Ç

<u>ላ</u>

25

in which R^1 , R^2 , R^3 and R^5 are as described for structure (I) and one of X^1 and X^2 is halogen and the other is R^4 or R^6 as appropriate, with a suitable amine of structure HNR^7R^8 in which R^7 and R^8 are as described for structure (I);

c) for compounds in which one of \mathbb{R}^4 or \mathbb{R}^6 is NH_2 , reduction of a compound of structure (IV) in which \mathbb{X}^1 or \mathbb{X}^2 10 is N_3 ; and

optionally thereafter, forming a salt.

- 7. A pharmaceutical composition comprising a compound according to any one of claims 1 to 5 or a pharmaceutically acceptable salt thereof, in association with a pharmaceutically acceptable carrier.
- A compound according to any one of claims 1 to 5
 for use in therapy, in particular in the treatment of gastrointestinal disorders.
 - A compound of structure (II) as defined in claim
 - 10. A compound of structure (IV) as defined in claim 6.

ANNEX TO THE INTERNATIONAL SEARCH REPORT ON INTERNATIONAL PATENT APPLICATION NO.

ΕP 9300176 SA 70313

This amex lists the patent family members relating to the patent documents cited in the above-mentioned international search report. The members are as contained in the European Patent Office EDP file on

The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
